

# Using AI Safely

We learn by reading lots from the internet, but not everything online is right! So sometimes, AI can mix up facts, stories and people's opinions. That's why it is important to double check what it says. If you are not sure something is true, look it up yourself or ask a trusted adult!

If you show something made by AI to others, tell them it was made by AI. This is important for pictures and videos, because they might look real - even when they're not! So always let people know it's not real, just something made by a computer

If the AI is free to use, it might keep what you write or say to help it learn more. So always be careful and don't share personal or private information with AI.

Sometimes AI can make mistakes or be unfair. That's because it learns from information that might be missing things or not fair to everyone. So, AI might treat some people or situations differently, even if there is no good reason. That's why you should always think for yourself and not just trust everything AI says. Ask questions, check facts and talk to a trusted adult if something doesn't feel right.

Generative AI tools are unable to distinguish between fact, fiction and opinion. As they gather information from all over the Internet, it's possible for them to get things wrong. Always check if something is true by doing your own research.
